

Class 2 Assignment Task 1

Exercise 1 Novice Vs Power User

The second Question was made only for me, because it uses my context like my budget, my photos use and my battery problem, so it gives me 3 real options and even picks one. The first answer was just general advice that fit any person but helps no one.

Exercise 2 Knows vs. Guesses

For the common topic the AI was confident and the answer was solid. But for the local news and the notice period it did not give a fake number, it told me clearly that it is not sure and the rule can change by country, which is the honest behaviour I wanted.

Exercise 3 The 3 Retrieval Modes

The weather prompt and the "latest this month" prompt made the AI actually search, and I could tell because it showed it was searching and it gave a current source with a link. The Romeo and Juliet one was instant from memory because it does not change.

Exercise 4 Context Is Everything

The single piece of context that change the answer the most was the time limit (only 30 minutes / the pending tasks). It removed all the options that did not fit and made the answer practical for my real situation.

Exercise 5 Think Hard

Yes, "think hard" gave a deeper answer. Instead of one quick suggestion it listed the real trade-offs, told me which one to pick first and why, and even said under what condition the answer would flip.

Exercise 6 Stop the Flattery

Yes, Step B gave me a reason I did not think before. When I asked to compare both sides instead of agreeing with me, it pointed out a strong point for the other option that the "bait" prompt completely skipped.

Exercise 7 The Brainstorm–Iterate Loop

Yes, the idea I ended with was better than anything in Round 1. Because after I gave feedback the AI fixed the exact thing I did not like, so the final version matched what I really wanted instead of a random first guess.

Exercise 8 Multimodal (Image & Audio)

The AI read most of the text correctly and made a clean transcription/summary. But it got a few small details wrong and it marked the unclear words with [unclear] and gave two guesses, so I knew which parts I had to check myself.

Exercise 9 Build a Small App

It worked almost first try and gave me a working tool from the Goal / Input / Output brief. In the iterate step I asked to make the buttons bigger, change the color and add a reset button, and it edited the same app in place instead of building it again.

Exercise 10 Data Analysis

In Round 1 it just gave numbers in a paragraph and I was not sure if it really calculate. I could tell the difference because in Round 2 it showed a real code block that ran, and the answer matched the correct values (median 65.5, average about 61.6), so Round 1 was probably guessing.

Exercise 11 Desktop Apps & Permissions

One thing I would never grant an AI app on day one is permission to delete files or change them permanently. Because deleted files often skip the recycle bin and edits overwrite the original, so a mistake can not be undone.

Exercise 12 Which Model When

On this task Claude gave a more clean and organised answer with better structure, while the other tool was a little more general. The main difference was in the formatting and how well it followed my exact instructions.

Exercise 13 Models Checking Models

Tool B caught one weak point that Tool A missed — it noticed that my draft was missing evidence to support a claim, while Tool A only focused on the clarity and structure. This show me that two different families have different blind spots.
