

Task 2 — Snake Game Report

Game Link: <https://monster-snake.netlify.app/>

Prompt iterations used during development

First i ask for a full Snake game in one HTML file with controls, score and game over. Then i improve it step by step — remove the walls, add sounds, spacebar pause, bonus fruits, countdown and a retro theme.

What worked well

The Goal / Input / Output shape gave a working game almost first try. Editing one feature at a time worked great, because the old features did not break.

What did not work

Short and general prompts gave general results that was not what i imagine. Asking too many changes in one prompt made it hard to know which change worked.

How prompts were improved over time

I started to add clear context and write the output as a clear list. After the first version i asked only one small change at a time, test it, then move to the next.

Challenges faced during the process

The snake was reversing into itself, so i ask the AI to block the instant reverse. Keeping all features in one file without breaking old ones was solved by the iterate loop.

Tool used

I used Claude to generate and improve the game, all in a single self-contained HTML file with no external library.
