

PROJECT TITLE AND WHAT IT DOES

One sentence, live data, finished artifact. Combines the Task 1 Skill with the Task 2 Connector so a single plain-English request finds a real file in Drive, reads it, and formats it into my study tool — with no copy-paste at any point in the chain.

AI TOOLS AND APPS USED

TOOL / APP	ROLE
Claude (Opus 4.8)	The agent running both halves
weekly-study-notes Skill	Expertise — shapes the output my way
Google Drive connector	Access — finds and reads the real file (read-only)

THE PROMPT I USED

Find this week's class notes in my Drive and make study notes from them.

One sentence. It names neither the skill nor the connector — that is the test. The sentence has two halves and each is handled by a different feature:

HALF OF THE SENTENCE	HANDLED BY	WHAT IT DOES
"Find this week's class notes in my Drive"	Connector (access)	Searches Drive, finds the file, reads the content
"make study notes from them"	Skill (expertise)	Formats it into my study-tool artifact

This is the course's pattern exactly: **the Connector fetches the real data; the Skill shapes the output your way.** Neither is useful alone here — a connector without the skill hands me a raw dump; a skill without the connector needs me to paste the file in by hand.

WHAT HAPPENED

- Drive was searched for class notes.
- Found `class notes thesis` — a Markdown file in my *Agent Factory Decks* folder, modified 17 July.
- The file content was read through the connector.
- The skill formatted it: **10 sheets, 50 tap-to-reveal callouts, 3 scored questions.**

The source was The Agent Factory Thesis — a long, dense chapter. The skill derived its visual direction from the material's own language (invariants as structure, named products as furniture) and produced a blueprint-styled artifact with a drawing title block and sheet numbering.

HOW I TESTED AND VERIFIED IT

The task's step 3 is a spot-check against the original, and it is the graded part. I opened the real `class notes thesis` file in Drive and checked specific figures from the artifact against it:

CLAIM IN THE ARTIFACT	SHEET	VERIFIED
Cursor: 35% of merged PRs produced by autonomous agents, Feb 2026	05	
74% run completion without durable execution; ~99.7% with step memoization	09	
US data center construction \$42B annualized; office construction down 35%	10	
Four payment rails: ACP, AP2, x402, MPP	06	

Numbers were chosen deliberately — they are the hardest thing to check by feel and the easiest thing to get subtly wrong.

WHAT WORKED, WHAT DID NOT, AND PROBLEMS I FACED

What worked

- **The one-sentence workflow held.** No copy-paste at any point. The file never left Drive; it was found, read, and formatted from a single request.
- **Read-only was enough for the whole chain.** The artifact came back to me as a file rather than being written to Drive, so nothing needed write scope.
- **The skill handled a source it was not designed for.** It was built for messy lecture fragments; the thesis is a long, already-structured chapter. It still grouped the material into its own sheets and pulled five terms each — the instructions generalised past their design case.

What did not work

"This week's" did no work whatsoever. The connector matched on filename keywords — it searched for files with "notes" or "class" in the title. It did not filter by date, despite my sentence saying "this week's." I had exactly one matching file in Drive, so the right file was found. **With three notes files, picking the right one would have been luck.**

This is the kind of thing that only shows up when you check *why* something worked rather than *that* it worked. The workflow succeeded and my mental model of it was wrong — the sentence was doing less than I thought, and my sparse Drive folder was doing more.

Problems faced

- **My Drive did not contain the right shape of file.** The obvious candidate was a finished .pptx deck — but a deck is structured output, and the skill exists to clean up mess. Running it on the deck would have demonstrated the weak case. I had to put real raw notes in Drive first, which is a setup step the task does not mention but the workflow requires.
- **The auto-fire is still unproven — same gap as Task 1.** This ran in a chat where the skill's full text was already loaded, so I cannot claim from this run that the *description* triggered it. The connector half is genuinely proven; the skill half is proven as instructions, not as a trigger.
